To write action script to play and stop animation in flash

Introduction :

- Action script is the programming language used in Adobe flash to add interactivity, control animations and manage multimedia elements within flash project.
- It allows you to go beyond simple timeline-based animations enabling features like buttons, games, etc.

macro-media flash:

- macro-media flash was a multimedia and animation platform that enabled the creation of interactive graphics, animation and web applications.
- flash combines a graphic and animation editor with a lightweight web player, making it ideal for delivering content over the internet.

Objectives :

- ① To be able to write an action script in macromedia flash
- ② To be familiar with the tools in macromedia flash.

Tools :

macromedia flash 8

Theory:

→ Abstract programming:

Abstract programming is a model where concrete details are hidden or generalized to focus on essential features and reduce complexity. This is achieved through abstraction, which allows programmers to work with simplified representation of objects, functions and systems, making code easier to manage and extend.

→ Objects:

- In OOP, an abstract object is defined by a class that specifies relevant attributes and behaviours but omits unnecessary details. Such objects often serve as templates, with some attributes or methods left unspecified until the object is instantiated.

→ Functions:

- In functional programming, abstraction is used when declaring a function; the function describes a general operation and specific details (arguments) are provided when the function is called. This allows code to be modular and reusable.

→ BMOs and CMOs :

• Basic Multimedia Object (BMO) :

- A Basic Multimedia Object is a fundamental, indivisible component in a multimedia system. It represents a single media type such as:

- Text
- Video
- Image
- Animation
- Audio

- These objects serve as the building blocks for more complex multimedia structures and do not contain other multimedia objects within them.

• Compound Multiple Object (CMO) :

- A compound multiple object is an aggregation of multiple basic multimedia objects. It contains a collection of component multimedia objects and specifies how they are related in terms of:

• Temporal relationships :

how the components are synchronized or sequenced over time. (e.g.: Audio and Video playing together).

• Configurational relationships :

how the components are connected or arranged spatially or logically. (e.g.: an image displayed with text or audio).

Steps:

- ① first, we create our animation sequence on the timeline
- ② Then we add a 2nd layer to our sequence.
- ③ in the 2nd layer we add the buttons using a rectangle tool and text tool.
- ④ we convert the buttons into symbol using the right-click and choose "Convert to Symbol...".
- ⑤ we right click the symbol i.e button and select the "Actions" option and add actionscript code.
- ⑥ Open the actions panel (window > Actions).
- ⑦ After that on the panel add the code.
- ⑧ check the "error" or "compile" button and stop.
- ⑨ Stop.

Output:

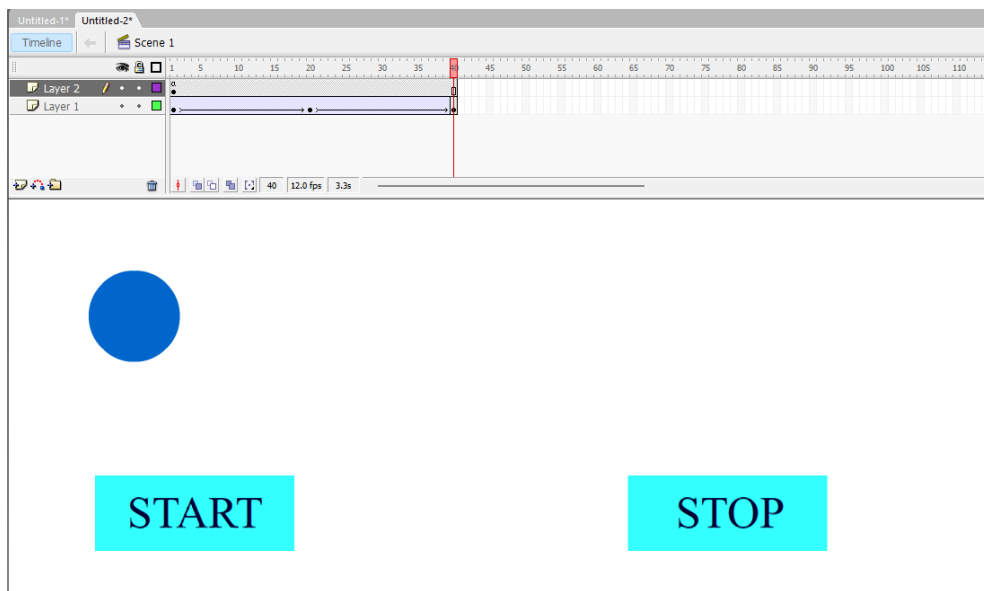

Fig: Animation alongside timeline

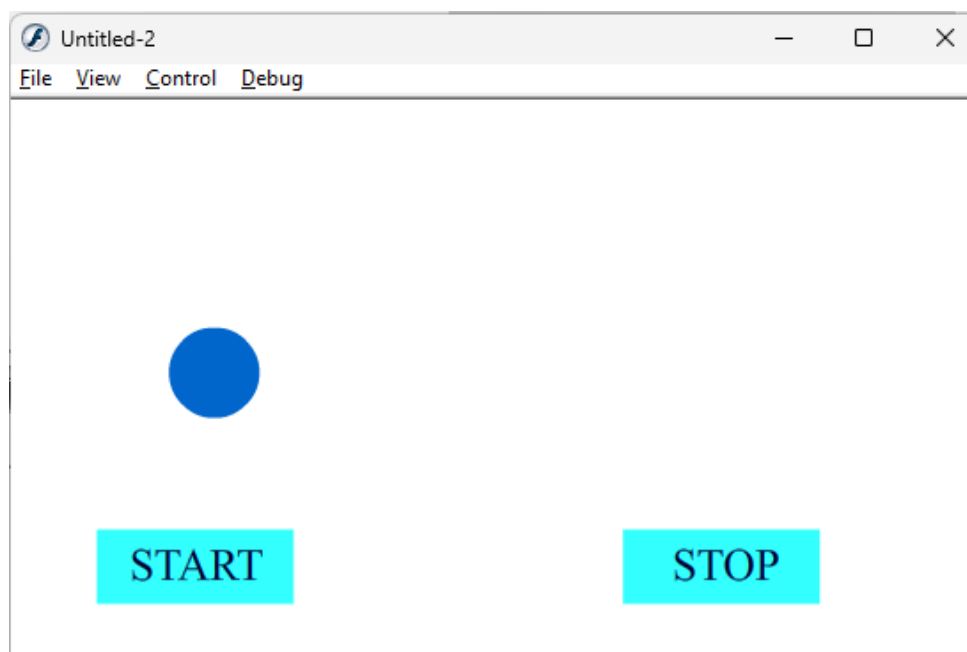

Fig: Animation after the export

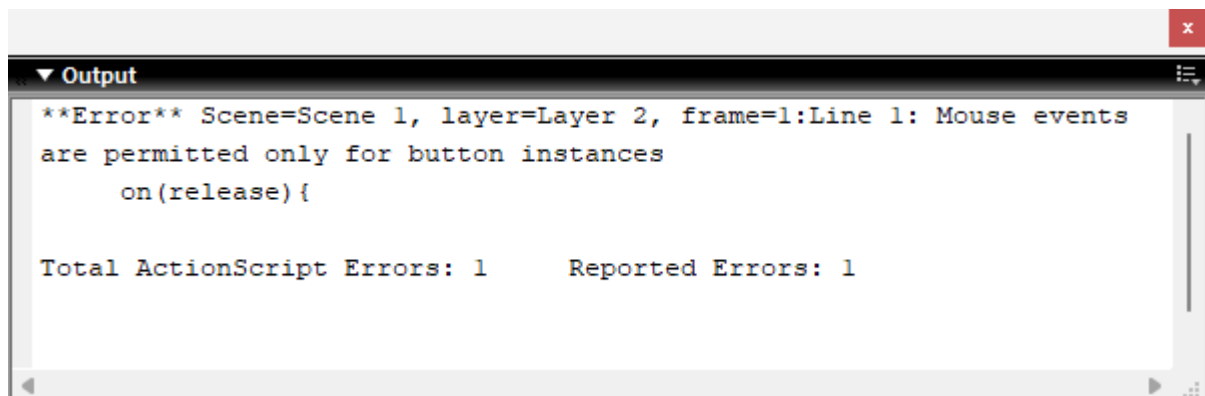

Fig: Output panel
